Preface — V

1 Introduction — 1

- 1.1 DAE optimal control problems — 8
 - 1.1.1 Perturbation index — 23
 - 1.1.2 Consistent initial values — 28
 - 1.1.3 Index reduction and stabilization — 30
- 1.2 Transformation techniques — 37
 - 1.2.1 Transformation of a Bolza problem to a Mayer problem — 37
 - 1.2.2 Transformation to fixed time interval — 38
 - 1.2.3 Transformation to autonomous problem — 39
 - 1.2.4 Transformation of Chebyshev problems — 39
 - 1.2.5 Transformation of L_1 -minimization problems — 40
 - 1.2.6 Transformation of interior-point constraints — 41
- 1.3 Overview — 44
- 1.4 Exercises — 46

2 Infinite optimization problems — 51

- 2.1 Function spaces — 51
 - 2.1.1 Topological spaces, Banach spaces, and Hilbert spaces — 52
 - 2.1.2 Mappings and dual spaces — 55
 - 2.1.3 Derivatives, mean-value theorem, and implicit function theorem — 57
 - 2.1.4 L_p -spaces, $W_{q,p}$ -spaces, absolutely continuous functions, functions of bounded variation — 60
- 2.2 The DAE optimal control problem as an infinite optimization problem — 68
- 2.3 Necessary conditions for infinite optimization problems — 75
 - 2.3.1 Existence of a solution — 78
 - 2.3.2 Conic approximation of sets — 79
 - 2.3.3 Separation theorems — 85
 - 2.3.4 First order necessary optimality conditions of Fritz John type — 87
 - 2.3.5 Constraint qualifications and Karush–Kuhn–Tucker conditions — 96
- 2.4 Exercises — 101

3 Local minimum principles — 105

- 3.1 Problems without pure state and mixed control-state constraints — 106
 - 3.1.1 Representation of multipliers — 112
 - 3.1.2 Local minimum principle — 114
 - 3.1.3 Constraint qualifications and regularity — 119
- 3.2 Problems with pure state constraints — 126
 - 3.2.1 Representation of multipliers — 128

3.2.2	Local minimum principle —	130
3.2.3	Finding controls on active state constraint arcs —	135
3.2.4	Jump conditions for the adjoint —	138
3.3	Problems with mixed control-state constraints —	141
3.3.1	Representation of multipliers —	143
3.3.2	Local minimum principle —	145
3.4	Summary of local minimum principles for index-one problems —	148
3.5	Exercises —	152

4 Discretization methods for ODEs and DAEs — 157

4.1	Discretization by one-step methods —	158
4.1.1	The Euler method —	159
4.1.2	Runge–Kutta methods —	161
4.1.3	General one-step method —	167
4.1.4	Consistency, stability, and convergence of one-step methods —	168
4.2	Backward Differentiation Formulas (BDF) —	175
4.3	Linearized implicit Runge–Kutta methods —	177
4.4	Automatic step-size selection —	183
4.5	Computation of consistent initial values —	188
4.5.1	Projection method for consistent initial values —	190
4.5.2	Consistent initial values via relaxation —	191
4.6	Shooting techniques for boundary value problems —	193
4.6.1	Single shooting method using projections —	194
4.6.2	Single shooting method using relaxations —	200
4.6.3	Multiple shooting method —	202
4.7	Exercises —	206

5 Discretization of optimal control problems — 212

5.1	Direct discretization methods —	213
5.1.1	Full discretization approach —	215
5.1.2	Reduced discretization approach —	220
5.1.3	Control discretization —	222
5.2	A brief introduction to sequential quadratic programming —	226
5.2.1	Lagrange–Newton method —	228
5.2.2	Sequential Quadratic Programming (SQP) —	230
5.2.3	A semi-smooth Newton method for quadratic programs —	238
5.3	Exploitation of sparsity in the full discretization approach —	241
5.3.1	Special cases —	245
5.3.2	Solving structured linear equation systems —	246
5.4	Calculation of derivatives for reduced discretization —	248
5.4.1	Sensitivity equation approach —	250
5.4.2	Adjoint equation approach: the discrete case —	252

5.4.3	Adjoint equation approach: the continuous case —	257
5.5	Discrete minimum principle and approximation of adjoints —	264
5.5.1	Example —	271
5.6	An overview on convergence results —	279
5.6.1	Convergence of the Euler discretization for ODE optimal control problems —	279
5.6.2	Higher order of convergence for Runge–Kutta discretizations for ODE optimal control problems —	284
5.6.3	Convergence results for DAE optimal control problems —	286
5.7	Numerical examples —	288
5.8	Exercises —	304
6	Real-time control —	308
6.1	Parametric sensitivity analysis and open-loop real-time control —	309
6.1.1	Parametric sensitivity analysis of nonlinear optimization problems —	309
6.1.2	Open-loop real-time control via sensitivity analysis —	318
6.2	Feedback controller design by optimal control techniques – the linear-quadratic regulator —	329
6.2.1	Systems in discrete time —	337
6.3	Model-predictive control —	342
6.3.1	Nonlinear MPC (NMPC) —	344
6.3.2	Linear-quadratic MPC (LMPC) —	354
6.4	Exercises —	359
7	Mixed-integer optimal control —	366
7.1	Global minimum principle —	367
7.1.1	Singular controls —	378
7.2	Variable time transformation method —	387
7.3	Switching costs, dynamic programming, Bellman’s optimality principle —	400
7.3.1	Dynamic optimization model with switching costs —	401
7.3.2	A dynamic programming approach —	403
7.3.3	Examples —	409
7.4	Exercises —	416
8	Function space methods —	419
8.1	Gradient method —	420
8.2	Lagrange–Newton method —	434
8.2.1	Computation of the search direction —	440
8.3	Exercises —	451
