Preface — V

About the authors — XXI

Chapter 1

Introduction — 1

- 1.1 Linear distributed parameter systems — 1
- 1.2 Initial-boundary value problems — 4
- 1.3 Conventional analytical solution methods — 6
 - 1.3.1 Eigenfunction expansion — 7
 - 1.3.2 The Green's function method — 10
 - 1.3.3 Solution by Laplace transform — 12
- 1.4 Limitations of conventional analytical methods — 14
 - 1.4.1 Problems with non-self-adjoint operators — 14
 - 1.4.2 Response to boundary excitations — 15
 - 1.4.3 Inverse Laplace transform for time-domain solutions — 15
 - 1.4.4 Solution of multibody problems — 15
- 1.5 The distributed transfer function method — 17
 - 1.5.1 Distributed transfer functions — 17
 - 1.5.2 Integral formulas for general distributed parameter systems — 19
 - 1.5.3 The distributed transfer function method and its special features — 20
- 1.6 The scope of this writing — 21
- References — 22

Chapter 2

Distributed transfer function method for single-body problems — 27

- 2.1 Spatial state-space formulation — 27
- 2.2 State-space formulation for time-independent equations — 32
- 2.3 Eigenvalue problems — 34
 - 2.3.1 Equivalent eigenvalue problems — 34
 - 2.3.2 Eigensolutions for uniform systems — 36
- 2.4 Exponential matrix — 39
- 2.5 Distributed transfer function formulation — 41
- 2.6 Green's function formulas — 45
- 2.7 Static response and steady-state response — 46
 - 2.7.1 Static response — 46
 - 2.7.2 Steady-state response to harmonic excitations — 48
- 2.8 Transient response by the residue theorem — 49
 - 2.8.1 Transfer function residues — 49
 - 2.8.2 Transient response — 50

2.8.3	Computation of transfer function residues —	52
2.9	Nonuniformly distributed parameter systems —	55
2.9.1	State transition matrix —	55
2.9.2	Eigensolutions —	56
2.9.3	Transfer function formulation and Green's function formula —	57
2.9.4	System response by the DTFM —	59
2.9.5	Computation of transfer function residues —	61
2.10	Computation of state transition matrix —	61
2.10.1	Analytical solution method —	62
2.10.2	Semi-analytical solution method —	63
2.10.3	Numerical methods —	65
2.11	Systems governed by integro-differential equations —	66
	References —	68

Chapter 3

Distributed transfer function method for multibody problems — 71

3.1	The DTFM for systems of stepped configuration —	71
3.1.1	System description —	72
3.1.2	Spatial state-space equations —	75
3.1.3	Global state-space formulation —	77
3.1.4	Eigenvalue problem —	79
3.1.5	Transfer function formulation —	80
3.2	The DTFM for systems of laminated configuration —	80
3.2.1	Systems of full lamination —	81
3.2.2	Systems of partial lamination —	84
3.2.3	Systems of dislocated lamination —	87
3.3	Transfer function synthesis for systems of branched configuration —	87
3.3.1	Representation of component response by nodal displacements —	88
3.3.2	Assembly of components —	91
3.3.3	Solution to eigenvalue and response problems —	93
3.3.4	The limitations of the DTFS —	94
3.4	The augmented distributed transfer function method —	95
3.4.1	Scaled state equations for components —	95
3.4.2	Augmented state-space formulation —	96
3.4.3	Solutions to eigenvalue and response problems —	100
3.4.4	Comparison of the DTFS and the augmented DTFM —	102
3.5	Three types of component interconnection —	103
3.5.1	Stepped systems with disturbances at interior nodes —	103
3.5.2	Laminated systems —	106
3.5.3	Pointwise connection of distributed components —	106
3.6	Combined distributed-lumped systems —	109

- 3.6.1 Connection of a distributed and lumped systems at a single point — **110**
- 3.6.2 Connection of distributed and lumped systems at multiple points — **114**
- References — **118**

Chapter 4

Control system formulation — 121

- 4.1 Introduction — **121**
- 4.2 Distributed plant models — **122**
 - 4.2.1 Type (a) plant model: pointwise sensor and pointwise actuator — **124**
 - 4.2.2 Type (b) plant model: distributed sensor and distributed actuator — **127**
 - 4.2.3 Plant models of types (c) and (d) — **128**
- 4.3 Control system formulation — **129**
 - 4.3.1 Formulation by a distributed plant model — **129**
 - 4.3.2 Formulation by an integral formula — **131**
- 4.4 Stability analysis — **135**
 - 4.4.1 Stability definition and control objective — **135**
 - 4.4.2 The root locus method — **136**
 - 4.4.3 A demonstrative example — **139**
- 4.5 Response of controlled distributed systems — **140**
 - 4.5.1 Case (a): both sensor and actuator at the boundaries — **141**
 - 4.5.2 Case (b): sensor at an interior point and actuator at a boundary point — **143**
 - 4.5.3 Case (c): sensor at a boundary point and actuator at an interior point — **144**
 - 4.5.4 Case (d): both sensor and actuator at interior points — **145**
- 4.6 Control systems with multiple sensors and actuators — **145**
 - 4.6.1 System description — **145**
 - 4.6.2 Closed-loop characteristic equation — **146**
 - 4.6.3 Stability analysis and controller design — **148**
 - References — **148**

Chapter 5

Modeling and analysis of Euler-Bernoulli beams — 151

- 5.1 Introduction — **151**
- 5.2 Problem statement — **151**
 - 5.2.1 Dynamic problem — **151**
 - 5.2.2 Static problem — **154**
- 5.3 State-space formulation — **155**
 - 5.3.1 State-space formulation for a dynamic problem — **155**
 - 5.3.2 State-space formulation for a static problem — **157**
- 5.4 Static and dynamic analyses by the DTFM — **158**
 - 5.4.1 Static analysis — **158**

5.4.2	Eigensolutions — 159
5.4.3	Dynamic analysis — 161
5.5	Numerical examples — 163
5.5.1	Static response of a uniform beam — 163
5.5.2	Eigensolutions of an undamped uniform beam — 165
5.5.3	Dynamic response of a nonuniform beam — 168
	References — 172

Chapter 6

Modeling and analysis of Timoshenko beams — 173

6.1	Introduction — 173
6.2	System description — 173
6.2.1	Governing equations — 174
6.2.2	Internal forces — 178
6.2.3	Viscous damping — 178
6.2.4	Uniform Timoshenko beam — 178
6.2.5	Effects of shear deformation and rotary inertia — 179
6.3	State-space formulation — 180
6.4	Solution by the DTFM — 182
6.4.1	Static analysis — 182
6.4.2	Eigensolutions — 187
6.4.3	Frequency response — 188
6.4.4	Transient response — 188
6.5	Vibration of a spinning Timoshenko beam — 189
6.6	Numerical examples — 190
6.6.1	Static response of a Timoshenko beam — 191
6.6.2	Transient response of a Timoshenko beam in vibration — 193
6.6.3	Eigenvalue loci of a spinning Timoshenko beam — 196
	References — 197

Chapter 7

Buckling, statics, and dynamics of beam-columns — 199

7.1	Introduction — 199
7.2	System description — 199
7.2.1	Euler-Bernoulli beam-column — 200
7.2.2	Timoshenko beam-column — 204
7.3	State-space formulation — 209
7.3.1	State-space formulation of Euler-Bernoulli beam-column — 209
7.3.2	State-space formulation of Timoshenko beam-column — 211
7.4	The DTFM-based analyses — 213
7.4.1	Static analysis — 214
7.4.2	Eigensolutions — 216

7.4.3	Buckling analysis of columns —	216
7.4.4	Dynamic analysis of beam-columns —	218
7.5	Stepped and nonuniform beam-columns —	219
7.5.1	Stepped beam-columns —	220
7.5.2	Nonuniform beam-columns —	223
7.6	Numerical examples —	224
7.6.1	Eigensolutions of beam-columns —	224
7.6.2	Transient response of a Timoshenko beam-column —	226
	References —	227

Chapter 8

Modeling and analysis of bars, shafts, and strings — 229

8.1	Introduction —	229
8.2	Problem statement —	229
8.2.1	Dynamic problem —	229
8.2.2	Static problem —	231
8.3	State-space formulation —	232
8.3.1	State-space formulation for a dynamic problem —	232
8.3.2	State-space formulation for a static problem —	233
8.4	Static and dynamic analyses by the DTFM —	234
8.4.1	Static analysis —	234
8.4.2	Eigensolutions —	235
8.4.3	Dynamic analysis —	235
8.5	State transition matrices in analytical form —	237
8.5.1	Systems of homogeneous distribution —	238
8.5.2	Systems of inhomogeneous distribution —	239
8.6	Stepped second-order distributed systems —	242
8.6.1	Problem statement —	242
8.6.2	State-space formulation of stepped systems —	243
8.6.3	Analyses by the DTFM —	246
8.7	Numerical examples —	249
8.7.1	A nonuniform shaft in torsional vibration —	249
8.7.2	A three-segment bar in longitudinal vibration —	251
	References —	256

Chapter 9

Modeling and analysis of stepped and combined beams — 257

9.1	Introduction —	257
9.2	Dynamic and static problems of stepped beam —	257
9.2.1	Dynamic problem —	257
9.2.2	Static problem —	261
9.3	State-space formulation —	262

9.3.1	State-space formulation for a dynamic problem —	262
9.3.2	State-space formulation for a static problem —	266
9.4	Solution by the DTFM —	267
9.4.1	Static analysis —	267
9.4.2	Eigensolutions —	269
9.4.3	Dynamic analysis —	270
9.5	Augmented state-space formulation —	272
9.5.1	Augmented state-space formulation for a dynamic problem —	272
9.5.2	Augmented state-space formulation for a static problem —	274
9.6	Analyses by the augmented DTFM —	275
9.6.1	Static analysis —	275
9.6.2	Eigensolutions —	276
9.6.3	Dynamic analysis —	276
9.7	A double-beam problem —	277
9.8	Modeling and analysis of combined beams —	279
9.8.1	A single beam with a mounted rigid body —	280
9.8.2	A stepped beam with a linear oscillator —	287
9.9	Moving force problem —	291
9.10	Numerical example —	295
	References —	299

Chapter 10

Modeling and analysis of frame structures — 301

10.1	Introduction —	301
10.2	Problem statement —	301
10.2.1	Dynamic problem —	301
10.2.2	Static problem —	306
10.3	Augmented state-space formulation —	307
10.3.1	Augmented state-space formulation for a dynamic problem —	308
10.3.2	State-space formulation for a static problem —	310
10.4	Solution by the augmented DTFM —	312
10.4.1	Static analysis —	312
10.4.2	Eigensolutions —	314
10.4.3	Dynamic analysis —	315
10.5	Distributed transfer function synthesis —	317
10.5.1	Modeling by the DTFS —	317
10.5.2	Solution by the DTFS —	322
10.6	A numerical example —	323
10.6.1	Augmented state-space formulation —	323
10.6.2	Numerical simulation —	325
	References —	330

Chapter 11

Modeling and analysis of axially moving continua — 331

- 11.1 Introduction — **331**
- 11.2 Axially moving strings — **331**
 - 11.2.1 Governing equations — **331**
 - 11.2.2 State-space formulation — **332**
- 11.3 Axially moving beams — **333**
 - 11.3.1 Axially moving Euler-Bernoulli beam — **333**
 - 11.3.2 Axially moving Timoshenko beam — **336**
- 11.4 Solution by the DTFM — **338**
 - 11.4.1 Eigensolutions — **338**
 - 11.4.2 Dynamic analysis — **342**
- 11.5 Axially moving continua on a partially distributed viscoelastic foundation — **343**
 - 11.5.1 Axially moving string over a partially distributed viscoelastic foundation — **344**
 - 11.5.2 Axially moving beam over a partially distributed viscoelastic foundation — **347**
 - 11.5.3 Solution by the DTFM — **350**
- 11.6 Determination of critical speed by the DTFM — **352**
 - References — **354**

Chapter 12

Heat conduction in one-dimensional composite mediums — 355

- 12.1 Introduction — **355**
- 12.2 Heat conduction in single bodies — **356**
 - 12.2.1 Heat conduction in a slab — **356**
 - 12.2.2 Heat conduction in a hollow cylinder — **360**
 - 12.2.3 A note on nonuniform distribution of material properties — **366**
- 12.3 Heat conduction in multilayer composite slabs — **367**
 - 12.3.1 Problem statement — **367**
 - 12.3.2 Global state-space formulation — **368**
 - 12.3.3 Global state transition matrix — **370**
 - 12.3.4 Eigensolutions — **371**
 - 12.3.5 Global transfer function formulation — **372**
 - 12.3.6 Determination of system response — **373**
- 12.4 Heat conduction in hollow composite cylinders — **375**
 - 12.4.1 Problem statement — **376**
 - 12.4.2 Global state-space formulation — **377**
 - 12.4.3 Global state transition matrix — **378**
 - 12.4.4 Eigensolutions — **380**
 - 12.4.5 Global transfer function formulation — **380**

12.4.6	Determination of system response —	381
12.5	Numerical examples —	383
12.5.1	A two-layer slab subject to an initial temperature —	383
12.5.2	A seven-layer composite slab under a boundary excitation —	384
12.5.3	A seven-layer cylinder with an energy source —	387
12.6	Hollow composite spheres and branched mediums —	390
12.6.1	Hollow composite sphere —	390
12.6.2	Branched composite medium —	393
	References —	395

Chapter 13

Analysis and control of one-dimensional acoustic field in a duct — 397

13.1	Introduction —	397
13.2	Problem statement —	397
13.3	State-space formulation —	400
13.4	Dynamic analyses by the DTFM —	401
13.4.1	Eigenvalue problem —	402
13.4.2	Frequency response to harmonic excitations —	405
13.4.3	Transient response —	405
13.5	State transition matrix for specific ducts —	408
13.6	Formulations of duct control systems —	409
13.6.1	Interior control —	409
13.6.2	Boundary control —	412
13.6.3	Close-loop characteristic equation —	413
13.7	Time-delay relations for ducts under feedback control —	414
13.7.1	Time-delay relations for a uniform duct with two open ends —	414
13.7.2	Time-delay relations of a duct with one closed end and one open end —	418
13.8	Stability analysis of delayed feedback control system —	420
13.8.1	Root locus method —	420
13.8.2	Stability analysis of noncollocated duct control system —	421
13.9	Response of a controlled duct —	425
	References —	427

Chapter 14

Modeling and analysis of beams with viscoelastic and piezoelectric materials — 429

14.1	Introduction —	429
14.2	Single-layered beams of viscoelastic materials —	430
14.2.1	Models of viscoelastic materials —	430
14.2.2	Governing equations —	433
14.2.3	Spatial state-space formulation in the s -domain —	434

14.3	Dynamic analysis by the DTFM —	436
14.3.1	Eigensolutions —	436
14.3.2	Transfer function formulation —	437
14.3.3	Frequency response —	437
14.3.4	Transient response —	438
14.3.5	An example —	439
14.4	Sandwich beams with viscoelastic core —	441
14.4.1	Sandwich beams of a thin viscoelastic core —	442
14.4.2	Sandwich beams of a thick viscoelastic core —	444
14.5	Multilayered elastic-viscoelastic beams —	447
14.5.1	A two-layer beam —	448
14.5.2	A three-layer beam —	450
14.5.3	Beams with partial viscoelastic layers —	455
14.5.4	Two beams partially coupled by a viscoelastic layer —	460
14.6	Beams with piezoelectric layers —	464
14.6.1	Beams with a full piezoelectric layer —	464
14.6.2	Beams with a partial piezoelectric layer —	471
14.7	Energy harvesting beams —	471
	References —	474

Chapter 15

Other one-dimensional problems — 477

15.1	Introduction —	477
15.2	Natural frequency splitting of an electric guitar string —	477
15.2.1	A coupled string-magnet system —	478
15.2.2	State-space formulation —	479
15.2.3	Natural frequency splitting —	480
15.3	Noncolocated control of an axially moving string —	481
15.3.1	Governing equations of an axially moving string —	481
15.3.2	Control system formulation —	482
15.3.3	Stability analysis by the root locus method —	484
15.4	The telegrapher's equations and multiconductor transmission lines —	486
15.4.1	Analytical solutions of the telegrapher's equations —	487
15.4.2	Solutions of the hyperbolic telegraph equation —	489
15.4.3	Coupled transmission lines —	490
15.4.4	Synthesis of multiconductor transmission lines —	492
15.5	The time-dependent Schrödinger equation —	494
15.6	Linear thermoelasticity problems —	496
15.6.1	Problem statement —	497
15.6.2	Solution by the DTFM —	497
15.6.3	Extension to stepped thermoelastic bars —	499

15.7	One-dimensional diffusion processes —	502
15.7.1	Linear diffusion equation —	503
15.7.2	Convection-diffusion equation —	503
15.7.3	Diffusion through a composite porous medium —	505
15.7.4	Hyperbolic heat conduction —	507
15.8	Other applications —	507
	References —	508

Appendix

Laplace transforms — 513

A.1	Definition —	513
A.2	Properties of Laplace transformation —	515
A.3	Determination of inverse Laplace transforms —	517
A.3.1	Inverse Laplace transform by partial fraction expansion —	517
A.3.2	Inverse Laplace transform by residue theorem —	519
A.4	Application to differential equations —	519
	References —	521

Index — 523
