

Contents	Page
Part A: Numerical Optimization in Aerodynamic Design	1
I. Introduction	3
II. Definition of the Problems for the Analysis	7
1. Definition of test cases	7
2. ECARP data base: access rules and storage formats	33
3. ECARP data base: visualization tools	45
III. Contributions to the Resolution of the Data Workshop Test Cases ..	49
1. On the optimization of a wing-pylon-nacelle configuration	50
T. Fol, Aerospatiale Aircraft Business, Toulouse, France	
2. Optimization of transonic airfoils and wings	60
V. Selmin, Alenia Aeronautica, Torino, Italy	
2.1 Optimization of transonic airfoils	60
2.2 Optimization of transonic wings	64
3. Airfoil optimization using viscous/inviscid coupling code.....	80
J.M. Alonso, J.M. de la Viuda, A. Abbas, CASA, Getafe, Spain	
4. Optimization of the wing-pylon-nacelle testcase TE5 by HISST-D, a panel method-based design tool	99
L. Fornasier, Daimler-Benz Aerospace, München, Germany	
5. Design of a wing-pylon-nacelle configuration	110
H. Schwarten, Daimler-Benz Aerospace Airbus, Bremen, Germany	
6. Dassault contribution to the optimum design ECARP project	130
J. Periaux, B. Stoufflet, Dassault Aviation, St. Cloud, France	
7. Geometry optimization of airfoils by multi-point design	141
K.-W. Bock, W. Haase, Dornier, Friedrichshafen, Germany	
8. Riblet optimization	159
P. Le Tallec, INRIA, Rocquencourt, O. Pironneau INRIA & Univ. Paris 6, France	

Contents (continued)	Page
9. Aerodynamic design of a M6 wing of transonic wing using unstructured meshes	201
A. Dervieux, N. Marco, J.-M. Malé, INRIA Sophia Antipolis, France	
10. Part I. Single and two-point airfoil design using Euler and Navier-Stokes equations	211
Th.E. Labrujère, NLR, Amsterdam, Netherlands	
10. Part II. Application of genetic algorithms to the design of airfoil pressure distributions	231
C.F.W. Hendriks, Th.E. Labrujère, NLR, Amsterdam, Netherlands	
11. Design and optimization aspects of 2-D and quasi 3-D configurations using an inverse Euler solver	249
P. Chaviaropoulos, V. Dedoussis, K.D. Papailiou, NTUA Athens	
12. Optimum aerodynamic shape design including mesh adaptivity	263
G. Buggeda, E. Ofiate, UPC Barcelona, Spain	
IV. Synthesis of Test Cases	289
V. Conclusion and Perspectives	331
Part B: Navier Stokes Solution on MPP Computers	333
I. Introduction	335
II. Definition of the Problems for the Analysis	337
III. Contribution to the Resolution of the Data Workshop Test Cases ...	343
1. Flow computation for a NACA0012 with the parallel Navier-Stokes Solver CGNS	344
E.H. Hirschel, Daimler-Benz Aerospace, München, Germany	
T. Michl, S. Wagner, IAG, University of Stuttgart	

Contents (continued)	Page
2. Massively parallel computers for Navier-Stokes solutions on unstructured meshes	356
Q.V. Dinh, Dassault Aviation, St. Cloud, France	
P. Leca, F.X. Roux, ONERA, Chatillon, France	
3. Parallel computations on an IBM SP2 and SGI cluster	362
P. Eliason, FFA, the Aeronautical Research Institute of Sweden, Stockholm	
3.1 Parallel computations on an IBM SP2 and an SGI cluster for the NACA0012 airfoil	362
3.2 Parallel computations on an IBM SP2 for the MW6 wing	371
4. Contributions from INRIA to the test cases	375
S. Lanteri, INRIA Sophia Antipolis, France	
4.1 TP1 test case	375
4.2 TP2 test case	388
5. Viscous flow computations using structured and unstructured grids on the Intel-Paragon	404
D. Koubogiannis, K.C. Giannakoglou, K.D. Papailiou, NTUA, Athens, Greece	
6. Development of finite element algorithms for compressible viscous flows for parallel SIMD machines	414
T. Fischer, G. Buggeda, UPC, Barcelona, Spain	
7. Implementation of Navier-Stokes solvers on parallel computers	429
F. Grasso, C. Pettinelli, Univ. Roma, Italy	
8. Navier Stokes simulations on MIMD computers using the EURANUS code	441
C. Lacor, CH. Hirsch, VUB, Brussels, Belgium	
IV. Synthesis of Test Cases	451
V. Conclusion and Perspectives	463
Acknowledgements	465
Annex: List of Partners and Addresses	467
