Memorial Dedicated to Professor Antonio Ambrosetti — V

Preface — VII

## **1 A brief survey of some topics in calculus — 1**

- 1.1 First partial derivatives — 1
- 1.2 Second partial derivatives — 2
- 1.3 Line integrals — 3
- 1.4 The divergence theorem — 4
- 1.5 Fourier series — 5

## **2 First order linear differential equations — 8**

- 2.1 Introduction — 8
- 2.2 Linear homogeneous equations — 8
  - 2.2.1 Cauchy problem — 10
- 2.3 Linear nonhomogeneous equations — 13
- 2.4 Applications to RC electric circuits — 18
- 2.5 Exercises — 21

## **3 Analytical study of first order differential equations — 23**

- 3.1 General first order differential equations — 23
  - 3.1.1 Initial value problem — 25
- 3.2 Existence and uniqueness results — 25
  - 3.2.1 On uniqueness — 29
  - 3.2.2 Local vs. global existence — 31
- 3.3 Qualitative properties of solutions — 32
- 3.4 Appendix — 36
- 3.5 Exercises — 43

## **4 Solving and analyzing some nonlinear first order equations — 45**

- 4.1 Separable equations — 45
- 4.2 An application: the logistic equation in population dynamics — 48
- 4.3 Exercises on separable variables — 52
- 4.4 Homogeneous equations — 53
- 4.5 Exercises on homogeneous equations — 56
- 4.6 Bernoulli's equation — 57
- 4.7 Exercises on Bernoulli equations — 59
- 4.8 Clairaut's equation — 59
- 4.9 Exercises on Clairaut equations — 62

|          |                                                                |
|----------|----------------------------------------------------------------|
| <b>5</b> | <b>Exact differential equations — 63</b>                       |
| 5.1      | Exact equations — 63                                           |
| 5.2      | Solving exact equations — 64                                   |
| 5.2.1    | The initial value problem for exact equations — 65             |
| 5.3      | General solutions of exact equations — 67                      |
| 5.4      | Integrating factor — 74                                        |
| 5.5      | Appendix — 76                                                  |
| 5.6      | Exercises — 77                                                 |
| <br>     |                                                                |
| <b>6</b> | <b>Second order linear differential equations — 79</b>         |
| 6.1      | Preliminaries — 79                                             |
| 6.2      | General solution of $L[x] = h$ — 81                            |
| 6.2.1    | Linear dependence and independence — 81                        |
| 6.2.2    | Exercises on linear dependence and independence — 84           |
| 6.2.3    | General solution of homogeneous equation — 84                  |
| 6.2.4    | General solution of nonhomogeneous equation — 86               |
| 6.2.5    | Appendix: reduction of order method — 88                       |
| 6.3      | Equations with constant coefficients — 90                      |
| 6.3.1    | The homogeneous case — 90                                      |
| 6.3.2    | Applications — 92                                              |
| 6.3.3    | The non-homogeneous case — 95                                  |
| 6.3.4    | Exercises on equations with constant coefficients — 99         |
| 6.4      | Euler's equation — 100                                         |
| 6.4.1    | Exercises on Euler equations — 102                             |
| <br>     |                                                                |
| <b>7</b> | <b>Higher order linear equations — 103</b>                     |
| 7.1      | General results — 103                                          |
| 7.2      | Higher order linear equations with constant coefficients — 104 |
| 7.2.1    | Euler equations — 112                                          |
| 7.3      | Exercises — 113                                                |
| <br>     |                                                                |
| <b>8</b> | <b>Systems of first order equations — 115</b>                  |
| 8.1      | A brief review of matrices and determinants — 115              |
| 8.2      | General preliminaries — 121                                    |
| 8.3      | Linear systems — 123                                           |
| 8.4      | Linear systems with constant coefficients — 127                |
| 8.5      | Appendix: the exponential matrix — 138                         |
| 8.6      | Exercises — 140                                                |
| <br>     |                                                                |
| <b>9</b> | <b>Phase plane analysis — 143</b>                              |
| 9.1      | Preliminaries — 143                                            |
| 9.2      | Phase plane analysis: some examples — 144                      |

|           |                                                                            |
|-----------|----------------------------------------------------------------------------|
| 9.3       | Periodic solutions — 147                                                   |
| 9.3.1     | Remarkable examples — 150                                                  |
| 9.4       | Van der Pol's equation — 152                                               |
| 9.5       | Homoclinic and heteroclinic solutions — 155                                |
| 9.6       | On planar autonomous systems — 160                                         |
| 9.6.1     | The Lotka-Volterra prey-predator system — 160                              |
| 9.6.2     | Limit cycles — 164                                                         |
| 9.7       | Exercises — 165                                                            |
| <b>10</b> | <b>Introduction to stability — 167</b>                                     |
| 10.1      | Definition of stability — 167                                              |
| 10.2      | Stability of linear systems — 168                                          |
| 10.2.1    | Stability of $2 \times 2$ linear systems — 169                             |
| 10.2.2    | Stability of linear homogeneous equations with constant coefficients — 174 |
| 10.3      | Stability of conservative systems — 175                                    |
| 10.4      | The Lyapunov direct method — 177                                           |
| 10.5      | Stability by linearization — 180                                           |
| 10.6      | Further remarks — 183                                                      |
| 10.6.1    | Stable and unstable limit cycles — 183                                     |
| 10.6.2    | Hyperbolic equilibria: stable and unstable manifolds — 184                 |
| 10.6.3    | Change of stability: bifurcation of equilibria — 185                       |
| 10.7      | Exercises — 187                                                            |
| <b>11</b> | <b>Series solutions for linear differential equations — 190</b>            |
| 11.1      | A brief overview of power series — 190                                     |
| 11.2      | Ordinary points — 191                                                      |
| 11.3      | Bessel functions — 197                                                     |
| 11.3.1    | Bessel functions of first kind — 197                                       |
| 11.3.2    | General solution of $(B_m)$ and Bessel functions of second kind — 201      |
| 11.4      | Singular points: the Frobenius method — 202                                |
| 11.5      | Exercises — 206                                                            |
| <b>12</b> | <b>Laplace transform — 207</b>                                             |
| 12.1      | Definition — 207                                                           |
| 12.2      | Properties of $\mathcal{L}$ — 208                                          |
| 12.3      | Inverse Laplace transform — 212                                            |
| 12.4      | Solving differential equations by Laplace transform — 213                  |
| 12.5      | Exercises — 220                                                            |
| <b>13</b> | <b>A primer on equations of Sturm-Liouville type — 221</b>                 |
| 13.1      | Preliminaries — 221                                                        |
| 13.2      | Oscillation for self-adjoint equations — 223                               |

|           |                                                                                            |            |
|-----------|--------------------------------------------------------------------------------------------|------------|
| 13.2.1    | Sturm separation and comparison theorems —                                                 | <b>224</b> |
| 13.2.2    | Checking the oscillatory status of equations —                                             | <b>229</b> |
| 13.3      | Sturm–Liouville eigenvalue problems —                                                      | <b>233</b> |
| 13.4      | Exercises —                                                                                | <b>239</b> |
| <b>14</b> | <b>A primer on linear PDE in 2D. I: first order equations —</b>                            | <b>241</b> |
| 14.1      | First order linear equations in 2D —                                                       | <b>241</b> |
| 14.1.1    | Linear transport equations —                                                               | <b>241</b> |
| 14.2      | Appendix: an introduction to inviscid Burgers' equation —                                  | <b>251</b> |
| 14.3      | Exercises —                                                                                | <b>255</b> |
| <b>15</b> | <b>A primer on linear PDE in 2D. II: second order equations —</b>                          | <b>256</b> |
| 15.1      | The Laplace equation —                                                                     | <b>256</b> |
| 15.1.1    | Dirichlet problem on a ball and the method of separation of variables —                    | <b>257</b> |
| 15.1.2    | The maximum principle —                                                                    | <b>264</b> |
| 15.1.3    | Uniqueness of the Dirichlet problem —                                                      | <b>265</b> |
| 15.1.4    | Appendix: Dirichlet's integral —                                                           | <b>266</b> |
| 15.2      | The heat equation —                                                                        | <b>267</b> |
| 15.2.1    | Appendix: further properties of the heat equation —                                        | <b>270</b> |
| 15.3      | The vibrating string equation —                                                            | <b>272</b> |
| 15.3.1    | An initial value problem for the vibrating string: D'Alembert's formula —                  | <b>274</b> |
| 15.3.2    | Appendix: continuous dependence on the initial conditions —                                | <b>276</b> |
| 15.3.3    | The method of the characteristics —                                                        | <b>277</b> |
| 15.3.4    | A boundary value problem for the vibrating string: the method of separation of variables — | <b>280</b> |
| 15.4      | Exercises —                                                                                | <b>284</b> |
| 15.4.1    | Exercises on the Laplace equation —                                                        | <b>284</b> |
| 15.4.2    | Exercises on the heat equation —                                                           | <b>285</b> |
| 15.4.3    | Exercises on D'Alembert's equation —                                                       | <b>286</b> |
| <b>16</b> | <b>The Euler–Lagrange equations in the Calculus of Variations: an introduction —</b>       | <b>288</b> |
| 16.1      | Functionals —                                                                              | <b>288</b> |
| 16.2      | The Euler–Lagrange equation —                                                              | <b>289</b> |
| 16.3      | Least time principles —                                                                    | <b>294</b> |
| 16.3.1    | The brachistochrone —                                                                      | <b>294</b> |
| 16.3.2    | Fermat's principle in geometrical optics —                                                 | <b>299</b> |
| 16.4      | Stationary solutions vs. minima —                                                          | <b>302</b> |
| 16.5      | On the isoperimetric problem —                                                             | <b>303</b> |
| 16.6      | The Sturm–Liouville eigenvalue problem revisited —                                         | <b>306</b> |
| 16.7      | Exercises —                                                                                | <b>309</b> |

**Solutions — 311**

|                             |     |
|-----------------------------|-----|
| Solutions to Chapter 2      | 311 |
| Solutions to Chapter 3      | 313 |
| Solutions to Chapter 4      | 315 |
| Solutions to Section 4.3    | 315 |
| Solutions to Section 4.5    | 317 |
| Solutions to Section 4.7    | 317 |
| Solutions to Section 4.9    | 318 |
| Solutions to Chapter 5      | 319 |
| Solutions to Chapter 6      | 321 |
| Solutions to Section 6.2.2  | 321 |
| Solutions to Section 6.3.4  | 322 |
| Solutions to Section 6.4.1  | 325 |
| Solutions to Chapter 7      | 325 |
| Solutions to Chapter 8      | 327 |
| Solutions to Chapter 9      | 332 |
| Solutions to Chapter 10     | 334 |
| Solutions to Chapter 11     | 336 |
| Solutions to Chapter 12     | 340 |
| Solutions to Chapter 13     | 344 |
| Solutions to Chapter 14     | 346 |
| Solutions to Chapter 15     | 348 |
| Solutions to Section 15.4.1 | 348 |
| Solutions to Section 15.4.2 | 350 |
| Solutions to Section 15.4.3 | 352 |
| Solutions to Chapter 16     | 353 |
