

CONTENTS

LECTURE 1

Recent approaches in large-eddy simulations of turbulence

by M. Lesieur

1. The need for large-eddy simulations.....	1
2. LES in physical space: the formalism	2
2.1. Generalities.....	2
2.2. Eddy-viscosity and diffusivity	4
2.3. Smagorinsky's model.....	5
3. LES in spectral space.....	6
3.1. Spectral eddy viscosity and diffusivity.....	6
3.2. LES of isotropic turbulence	8
3.3. The spectral backscatter	9
3.4. Spectral dynamic model.....	10
4. Return to physical space.....	11
4.1. Structure-function model	11
4.2. Selective and filtered SF models.....	13
4.3. Generalized hyperviscosities	14
5. Mixing layer	15
5.1. Temporal mixing layer.....	15
5.2. Spatial mixing layers.....	19
6. The channel flow.....	20
7. Backward-facing step	23
8. Conclusion	26

LECTURE 2

Large eddy simulation: an introduction and perspective

by J.H. Ferziger

1. Introduction.....	29
2. Turbulence and its prediction	30
3. The basis of LES: Filtering.....	31
4. Subgrid scale modeling.....	32
4.1. Smagorinsky model.....	32
4.2. Scale similarity and mixed models.....	34

4.3. Dynamic procedure.....	35
4.4. Spectral models	36
4.5. Models based on RANS models.....	38
5. Effects of extra strains.....	38
6. Wall models.....	39
7. Numerical methods.....	40
8. Initial and boundary conditions.....	42
9. Accomplishments.....	43
10. Coherent structure capturing.....	44
11. Conclusions and recommendations.....	45

LECTURE 3

Large-eddy simulation and statistical turbulence models: complementary approaches

by W. Rodi

1. Introduction.....	49
2. Large-eddy simulation methods	50
3. Statistical turbulence models	52
4. Calculation examples.....	54
4.1. Developed flow in square ducts.....	54
4.2. Backward-facing-step and other separated flows.....	57
4.3. Vortex-shedding flow past a square cylinder.....	58
4.4. Flow over a surface-mounted cube.....	63
4.5. Flow in baffled stirred tank reactor.....	65
5. Conclusions.....	69

LECTURE 4

Modeling compressibility effects on turbulence

by T.B. Gatski

1. Introduction.....	73
1.1. Filtered conservation equations.....	75
1.1.1. Mass.....	75
1.1.2. Momentum.....	75
1.1.3. Resolved total energy.....	75
1.2. Mean conservation equations	76
1.2.1. Mass.....	76
1.2.2. Momentum.....	76

1.2.3. Total energy	77
1.3. Turbulent stress transport equations	78
2. Simulation of compressible turbulent flows	79
2.1. DNS	79
2.1.1. Homogeneous turbulence	79
2.1.2. Inhomogeneous turbulence	84
2.2. LES	87
3. Compressible turbulence closure models	88
3.1. Compressibility extensions to incompressible closures	89
3.1.1. Solenoidal dissipation rate	89
3.1.2. Pressure-strain rate correlation	90
3.1.3. Turbulent diffusion models	91
3.1.4. Algebraic stress models	92
3.2. Dilatation and scalar flux closure models	93
3.2.1. Dilatation dissipation	93
3.2.2. Pressure-dilatation	94
3.2.3. Mass flux	96
3.3. Wall functions	98
3.3.1. Temperature and velocity law of the wall	98
3.3.2. Wall function implementation	99
3.4. Near-wall models	100
3.4.1. Second-moment models	100
3.4.2. Two-equation models	101
4. Summary	101

LECTURE 5

Reynolds averaged and large eddy simulation modeling for turbulent combustion

by D. Veynante and T. Poinso

1. Introduction	105
2. Premixed and non premixed flames	106
2.1. Introduction	106
2.2. Premixed flames	108
2.3. Non premixed flames	109
3. Modeling of averaged transport equations	112
3.1. Introduction	112
3.1.1. Favre (mass weighted) averaging	112
3.1.2. Balance equations for mass fractions	113
3.2. A first simplified analysis: Taylor's expansion	115
3.3. Physical analysis	116

3.4. Premixed combustion.....	117
3.4.1. Turbulent flame speed	117
3.4.2. Algebraic models: eddy-break-up model.....	117
3.4.3. Flame surface density approaches.....	119
3.4.4. Probability density functions	121
3.5. Non premixed combustion	123
3.5.1 Algebraic expressions.....	123
3.5.2. Flame surface density approach	123
3.5.3. Probability density functions	124
3.6. Comments.....	124
4. Large eddy simulations for reacting flows.....	125
4.1. Introduction	125
4.2. Simplest approaches	126
4.2.1. Arrhenius law based on filtered quantities.....	126
4.2.2. Extension of algebraic Favre averaged approaches	127
4.2.3. Simple extension of the Germano dynamic system	127
4.3. LES models for non premixed combustion.....	128
4.3.1. Linear eddy model.....	128
4.3.2. Probability density functions.....	129
4.4. LES models for premixed combustion.....	130
4.4.1. Introduction.....	130
4.4.2. Artificially thickened flames.....	130
4.4.3. G -equation	131
4.5. Extensions.....	134
5. Conclusions.....	135

LECTURE 6

Modeling tools for flow noise and sound propagation through turbulence

by G. Comte-Bellot, C. Bailly and P. Blanc-Benon

1. Introduction.....	142
2. Methods for aeroacoustics predictions.....	143
2.1. Full-field computations	143
2.2. Kirchhoff formulation	143
2.3. Lighthill's analogy	144
2.4. Powell-Hardin and Möhring analogies	146
2.5. Lilley's equation.....	146
2.6. Linearized Euler equations: SNGR model.....	147
3. Examples of aeroacoustics predictions	149
3.1. Noise of isotropic turbulence.....	149
3.2. Jet noise.....	150

3.3. Diaphragm noise.....	151
4. Sound propagation through turbulence.....	153
4.1. Ray tracing method.....	154
4.2. Helmholtz equation.....	156
4.3. Parabolic approximation.....	157
5. Conclusion	160

LECTURE 7

Vortices in compressible LES and non-trivial geometries

by P. Comte

1. Introduction.....	164
2. Compressible LES formalism.....	165
2.1. LES filtering procedure.....	166
2.2. The simplest possible closure.....	167
3. Extension to curvilinear co-ordinates.....	169
4. Numerics.....	170
5. An academic case: the forced transition of a high-mach number boundary layer	172
6. Toward industrial applications: the vortex shedding inside a simplified solid rocket engine.....	176
7. Conclusion	180

LECTURE 8

LES-DNS: The aeronautical and defense point of view

by P. Sagaut, T.H. Lê and P. Moschetti

1. Introduction.....	184
2. The identified needs.....	185
3. The strategy	187
4. DNS and LES at ONERA: Status.....	188
4.1. Research on DNS and LES.....	188
4.2. DNS and LES as CFD tools.....	190
4.2.1. Transition and control	190
4.2.2. Aero-optics	190
4.2.3. Aerothermics.....	190
4.2.4. Acoustics.....	193

4.2.5. Combustion.....	194
5. The industrial challenge.....	194
6. Recommendations	196

LECTURE 9

Turbulence modeling in aeronautical flows

by B. Aupoix, J. Cousteix, G. Chevalier, S. Viala and P. Malecki

1. Introduction.....	199
2. Turbulence models.....	199
2.1. Introduction.....	199
2.2. Two-equation models	201
2.3. Reynolds stress models.....	202
3. Airfoil performances at high angles of attack	203
3.1. Introduction.....	203
3.2. Results.....	203
3.3. Analysis.....	205
4. Compressible boundary layers.....	206
4.1. Model performances	206
4.2. Model correction	207
4.3. Analysis.....	208
5. Three-dimensional boundary layers.....	208
5.1. Introduction.....	208
5.2. Model/experiment comparisons.....	209
6. Conclusions.....	213

LECTURE 10

Fluid instabilities in inertial confinement fusion

by D. Besnard, F. Ducros, D. Galmiche, Ph. Loreaux, B. Meyer and M. Naudy

1. Introduction.....	216
2. Instabilities in the ICF context	217
2.1. Ablative Rayleigh-Taylor instability.....	217
2.2. Rayleigh-Taylor instability	219
3. Turbulence and mix	220
4. Conclusion	224

LECTURE 11

Large eddy simulations in nuclear reactors thermal-hydraulics

by D. Grand and G. Urbin

1. Introduction.....	227
2. Numerical tool characteristics	229
3. Stratified recirculating flows.....	229
3.1. Flow downstream a backward facing step	229
3.2. Recirculating flow and thermal stratification in a rectangular cavity	232
4. Turbulent jets.....	235
4.1. Introduction.....	235
4.2. Flow configuration.....	235
4.3. The natural jet	236
4.4. The excited jet	237
5. Conclusion	240

LECTURE 12

Coherent vortices in rotating flows

by O. Métais and E. Lamballais

1. Introduction.....	243
2. Rotating free-shear flows	244
2.1. Coherent vortices topology	246
2.2. Vorticity stretching mechanisms	247
3. Rotating channel flow	250
3.1. Statistical results.....	250
3.2. Coherent-structure dynamics.....	252
4. Numerical simulation of baroclinic eddies	255
4.1. Direct numerical simulations.....	257
4.1.1. Large-eddy simulations.....	259
5. Turbulent convection into a rotating fluid	259
5.1. Dimensional arguments.....	259
5.2. Large-eddy simulations.....	261
6. Conclusion	261

LECTURE 13

Large-eddy simulation of air pollution dispersion: a review

by F.T.M. Nieuwstadt and J.P. Meeder

1. Introduction.....	265
2. Techniques for LES of turbulent dispersion	267
2.1. Eulerian method.....	267
2.2. Lagrangian method	270
3. Dispersion of passive contaminants	272
3.1. Dispersion in the CBL	272
3.2. Dispersion in the NBL	274
3.3. Dispersion in combination with chemistry	276
4. Summary and conclusions.....	279

LECTURE 14

Numerical simulations of compressible convection

by D.H. Porter and P.R. Woodward

1. Introduction.....	281
2. Discussion.....	282
2.1. Velocity power spectra	282
2.2. Correlations between vorticity and large-scale convection	284
3. Conclusion	289

LECTURE 15

Dynamical evolution of the turbulent interstellar medium at the kiloparsec scale

by A. Pouquet, T. Passot and E. Vazquez-Semademi

1. Introduction.....	291
2. The basic equations of the model	292
3. Main features of the computations.....	294
3.1. The equivalent barotropic gas.....	294
3.2. Vorticity production.....	294

- 4. Turbulence in the interstellar medium..... 295
 - 4.1. The structure of the medium at large scale..... 295
 - 4.2. On the nature of the turbulent density fluctuations..... 296
- 5. Summary and discussion..... 296
