1 Introduction 1

1.1 Problem definition 1

1.2 Objective 2

1.3 Outline 4

2 Design and execution of preloaded bolted connections in steel structures 7

2.1 General 7

2.2 Design and target levels of preloading 11

2.3 Preloading of bolting assemblies 16

2.3.1 General 16

2.3.2 Parameters for preloading 17

2.3.2.1 Tightening torque and k-class 17

2.3.2.2 Angle of rotation 19

2.3.3 Tightening methods 20

2.3.3.1 Modified torque method acc. to DAST-Guideline 024 20

2.3.3.2 Combined method acc. to EN 1090-2 and DAST-Guideline 024 23

2.4 Execution of corrosion protection on steel components 26

2.4.1 General 26

2.4.2 Preparation of steel substrates 28

2.4.3 Paint and powder systems 31

2.4.4 Thermal spraying 33

2.4.5 Hot dip galvanizing 34

2.5	Other reliability-determining factors with regard to design and execution of preloaded bolted connections	35
2.5.1	General	35
2.5.2	Preload losses	35
2.5.2.1	Self-loosening	36
2.5.2.2	Loosening	37
2.5.3	Slip factor	39
2.6	Summary and conclusions	42
3	Influencing factors for preloaded bolted connections during design and execution of steel structures	45
3.1	General	45
3.2	System reserves and reliability due to tightening method	48
3.2.1	Normative regulations in EN 1090-2 and DASt-Guideline 024	48
3.2.2	Reliability of different tightening methods	48
3.2.3	Considerable influencing factors on the construction site	52
3.2.4	Normative consideration of system reserves and other experimental findings	55
3.3	Regulations with regard to contact surfaces and handling of preload losses	62
3.3.1	(Preloaded) bolted connections	62
3.3.2	Slip-resistant connections and critical remarks regarding the consideration of preload losses	64
3.3.3	Specifications for consideration of preload losses in bolted connections acc. to EN 1090-2, Annex I and ZTV-ING	68
3.3.3.1	General remarks considering background investigations carried out by <i>Katzung et al.</i> [148]-[150]	71
3.3.3.2	Definition of a suitable amount of preload losses in EN 1090-2, Annex I and ZTV-ING	71
3.3.3.3	General remarks on potential loss of preload acc. to EN 1090-2, Annex I and ZTV-ING	76
3.3.3.4	Potential loss of preload for metal coatings and zinc rich primers acc. to EN 1090-2, Annex I and ZTV-ING	77
3.3.3.5	Potential loss of preload for multilayer coating systems acc. to EN 1090-2, Annex I and ZTV-ING	79

3.3.3.6	Test procedure to determine loss of preload acc. to EN 1090-2, Annex I	79
3.3.3.7	Evaluation of test results considering the test procedure to determine preload losses	81
3.3.4	Specifications in other international standards	83
3.3.4.1	General	83
3.3.4.2	RCSC Specification for Structural Joints using High-Strength Bolts	83
3.3.4.3	AS/NZS 5131 and AS 4100	85
3.3.4.4	IS 800 and IS 4000	86
3.3.4.5	SANS 10162-1	86
3.3.4.6	CSA S16-09	87
3.3.4.7	JASS 6	88
3.3.4.8	GB 50017	88
3.3.4.9	VDI 2230-1	89
3.3.4.10	IEC 61400-6	89
3.3.5	Literature review with regard to preload losses	91
3.3.5.1	General	91
3.3.5.2	Uncoated	91
3.3.5.3	Metal coating	92
3.3.5.4	Painted	93
3.4	Summary and conclusions	96
4	System reserves and preload losses for common applications in steel structures	99
4.1	General	99
4.2	Reference connections for fatigue loaded applications in steel structures	100
4.2.1	General	100
4.2.2	System reserves after tightening	104
4.2.3	Preload losses	108
4.2.4	Consideration of system reserves and preload losses over the service life	113
4.3	Connections with typical coating systems in steel structures	116
4.3.1	General	116
4.3.2	Investigated coating systems	118

4.3.3	System reserves after tightening	124
4.3.3.1	Modified torque method	125
4.3.3.2	Combined method	131
4.3.4	Preload losses	137
4.3.4.1	Investigated paint systems	137
4.3.4.2	Investigated powder coatings and coating systems	154
4.3.4.3	Summarizing remarks on experimentally deter- mined preload losses	164
4.3.4.4	Assessment of the experimentally determined preload losses with regard to their consideration in steel construction	177
4.3.4.5	Preload losses considering elastic resiliences of test specimens	189
4.3.5	Consideration of system reserves and preload losses over the service life of steel structures	195
4.4	Summary and conclusions	203
5	Slip resistance of bolted connections under consideration of prac- tical boundary conditions	205
5.1	General	205
5.2	Practical variation of the coating thickness	206
5.2.1	General	206
5.2.2	Test results	209
5.3	Procedure-related tightening of bolting assemblies	214
5.3.1	General	214
5.3.2	Test results	215
5.4	Preloads in bolted connections of existing steel bridges	220
5.4.1	General	220
5.4.2	Slip factor under consideration of cyclic loading	220
5.4.3	Determination of existing bolt preloads in slip-resistant connections after a service life of 18 years	222
5.5	Summary and conclusions	224
6	Amendments for standardization	227
6.1	General	227
6.2	Consideration of preload losses in steel construction	227
6.2.1	General	227

6.2.2	Handling of preload losses in bolted connections with typical coating systems	228
6.2.2.1	Criteria for the consideration of preload losses	228
6.2.2.2	Estimation of preload losses	230
6.2.3	Test to determine the loss of preload	230
6.2.3.1	General	230
6.2.3.2	Test procedure	233
6.2.3.3	Evaluation of the test results	234
6.3	Recommendations with regard to the execution of slip-resistant connections	236
6.3.1	General	236
6.3.2	Dealing with practical scattering of coating layer thicknesses in slip-resistant connections	237
6.3.3	Procedure-related tightening and slip resistance	238
6.4	Summary	238
7	Conclusions and outlook	241
	Bibliography	249
	Annex
